MedChain Enterprise

Company Profile

Oct 14, 2026 · @Randy

MedChain Enterprise is a Malaysian software business in Miri, Sarawak, which builds and supplies **SafeChain**, a workplace safety and health management platform delivered as a subscription service. The business is owner-operated, owns the technology it supplies, and is at the stage of seeking its first pilot deployment.

Company particulars

Registered name	MedChain Enterprise
Legal form	Sole proprietorship (enterprise)
Registration number	MRI/BNR/718/2026
Registered	30 June 2026, Miri, Sarawak
Registry	Sarawak Business Names Register
Business address	Lot 5377, Lorong 7, Jalan Sibu, Taman Tunku, 98000, Miri, Sarawak
Owner	Randy Richard
Email	randyrjm99@gmail.com
Mobile	011-3182 5377
Product	SafeChain: safechain.schain.workers.dev

The business trades as MedChain Enterprise and supplies a product named SafeChain. The names differ because the enterprise was registered for an earlier medical-records project and the safety platform grew out of it; the registered entity is unchanged.

What the business does

MedChain Enterprise builds and supplies **SafeChain**, a workplace safety and health management platform. It is sold as a subscription service, hosted online, with no software for the customer to install.

Safety management in Malaysian industry still runs largely on paper and spreadsheets. An incident is written on a form, an investigation is held in a folder, a corrective action is chased by WhatsApp, and at month end somebody spends a morning assembling a report from six places. Nothing in that chain can answer a simple question quickly: which actions are overdue, who owns them, and what happened last month.

SafeChain holds that work in one system, organised as organisation, project, site, and the safety activity at each site:

- **Incidents**: reporting, an eight-stage investigation workflow, evidence and sign-off
- **Corrective actions**: owners, due dates, overdue visibility, verification separate from completion
- **Permits to work**: hot work, confined space, work at height, lifting, with approval chains
- **Assets and inspections**: equipment records, inspection scheduling, defects raised as actions
- **Training and competency**: certificates, expiry, matrix by role
- **Contractors and visitors**: site access and records
- **Audits and compliance**: findings and their corrective actions
- **Reporting**: a consolidated monthly safety report, generated as a document rather than assembled by hand

The product is in English, built for Malaysian operating practice, and designed around what a safety officer does during a shift rather than around a database.

Technology and ownership

The technology is our own. SafeChain was designed and written by the founder. The business is not an agent, reseller or distributor for any third party, and no part of the platform is licensed in from another vendor. There is no joint ownership, no outsourced development house holding rights, and no investor or university claim over the intellectual property.

The platform is built on established open-source components: a React web application, a Node.js and TypeScript service layer, and a PostgreSQL database, deployed as a containerised stack behind a TLS-terminating proxy. These are used under their own open-source licences in the ordinary way, and none of them restricts commercial supply of the product.

What is proprietary is the application itself: the data model, the safety workflows, the permission and tenant-separation design, the report generation, and the user interface. A one-page architecture overview is available on request.

Capability

The business has delivered working software, not concepts. Two projects evidence this.

SafeChain is a complete, running system. It is deployed as a six-service containerised stack (database, scheduled worker, backup service, application programming interface, web application and reverse proxy) with role-based permissions across six roles, organisation-level separation of customer data enforced in both the application and the database schema, server-generated reports in PDF, and an audit trail held separately from the records it describes. A demonstration carrying invented sample data is published at **safechain.schain.workers.dev** and may be opened without an appointment.

MedChain, the project the enterprise is named after, is a medical-certificate verification prototype. It anchors a cryptographic fingerprint of each certificate on a public blockchain so that an employer can check whether a certificate presented to them is genuine or altered. It is deployed to the Ethereum Sepolia public test network (a test network, not a production chain) and is a demonstrator rather than a commercial service.

Founder. Randy Richard is studying for a Diploma in Occupational Safety and Health at Fajar International College and wrote both systems. That combination is the business's main asset: the product is specified by somebody training in the discipline it serves, and built by the same person, so the gap between what a safety officer needs and what the software does is unusually short.

Current stage

Stated plainly, because an assessor finds it out anyway:

Trading status	Registered 30 June 2026; pre-revenue
Customers	None to date
Pilots	None to date; actively seeking a first pilot
Written expressions of interest	None to date
Employees	Owner-operated
Certifications	None held. No ISO 27001, no SOC 2, and no assessed statement of compliance with the Personal Data Protection Act 2010
External funding	None raised
Patents	None filed

What the business has instead is a finished product that can be opened and used today, and a founder who can configure it for a customer in person.

What we are asking for is the opportunity to demonstrate SafeChain and to run a controlled pilot at one site, scoped and measured by agreement. We are not seeking funding, and we make no claim to any PETRONAS endorsement, approval or appointment.

Market focus

The initial market is **Miri and Sarawak**: oil and gas services, construction, marine and engineering businesses operating multiple sites with contractor workforces. These are firms large enough to carry real safety obligations and generally too small to buy an enterprise safety system from an international vendor.

Being based in Miri is deliberate rather than incidental. The sites, the contractors and the regulatory expectations are the ones the founder knows, and a supplier who can reach a customer's site the same day is worth more to a first pilot than one who cannot.

Beyond Sarawak, the same product serves comparable operators across Malaysia without modification.
